

Emergency Backup Communications

Does your company have a Communications Backup Plan?

Whether it be natural disasters – such as hurricanes, floods, tornados, wildfires, earthquakes, etc. – technical errors, or manmade disasters, you want to be certain that your business will still be able to function properly when normal modes of communication have been interrupted or halted completely. For instance, the Nashville bombing on Christmas Day in 2020 caused telecom services to go down or become unreliable for four days. In addition to damaging nearby residences and businesses, air traffic at Nashville International Airport temporarily came to a standstill because they had lost internet service.

Streaming Media Live knows what you need!

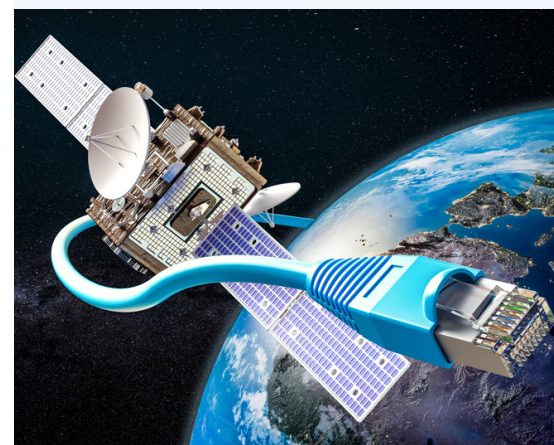

Disaster recovery organizations have used satellites for decades to restore connections to areas hard hit by disasters. Satellites have proven their value as daily links to remote facilities by natural resources, transportation, energy and other companies.

In addition, many organizations use satellites for diverse, hot-standby links to keep data centers, warehouses, call centers, and government and healthcare facilities online during commercial network outages.

Satellite mobile voice and internet services offer excellent solutions for supporting engineering, construction and transportation operations in rural areas as well.

Streaming Media Live can provide you with expert advice on how satellites can play a vital role in helping you maintain your connectivity needs during a communications blackout.

- Provide you with a thorough risk assessment regarding connectivity
- Advise on the best ways to add redundancy using alternate, failover and backup solutions
- Assist in the preparation of comprehensive disaster recovery plans

...FROM ANYWHERE TO EVERYWHERE!
